Group 4

Group Members:

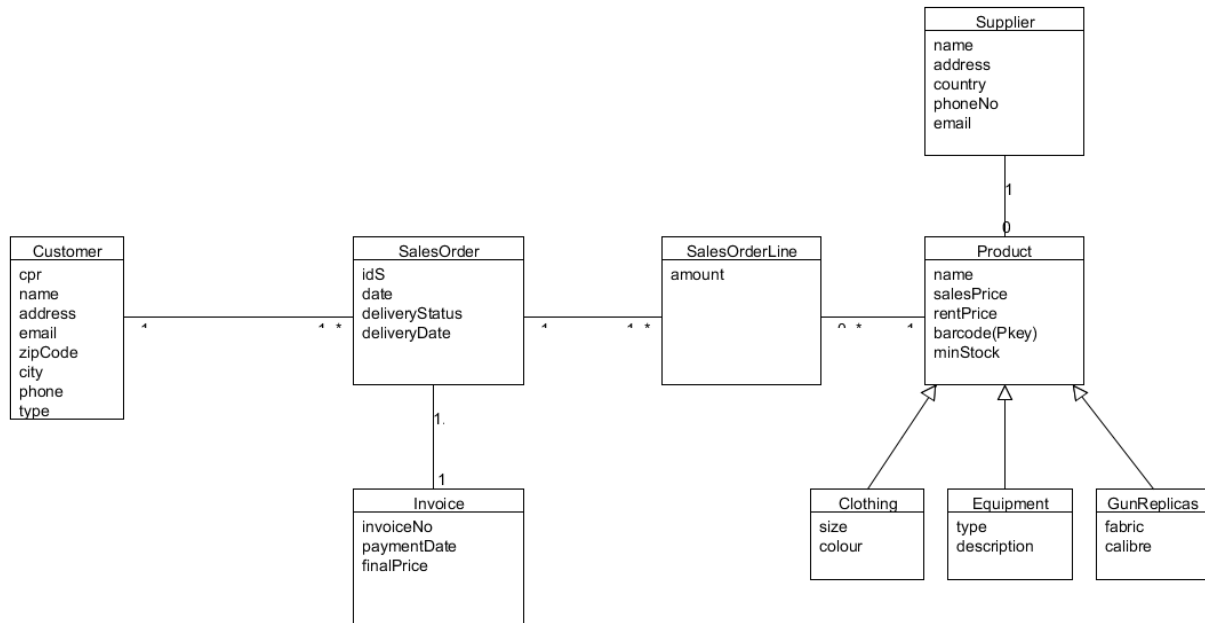

- Andrei Lucaci
- Cosmin Stan
- Cristian Moldovan
- Razvan Andrei
- Robert Ivan

Supervisors

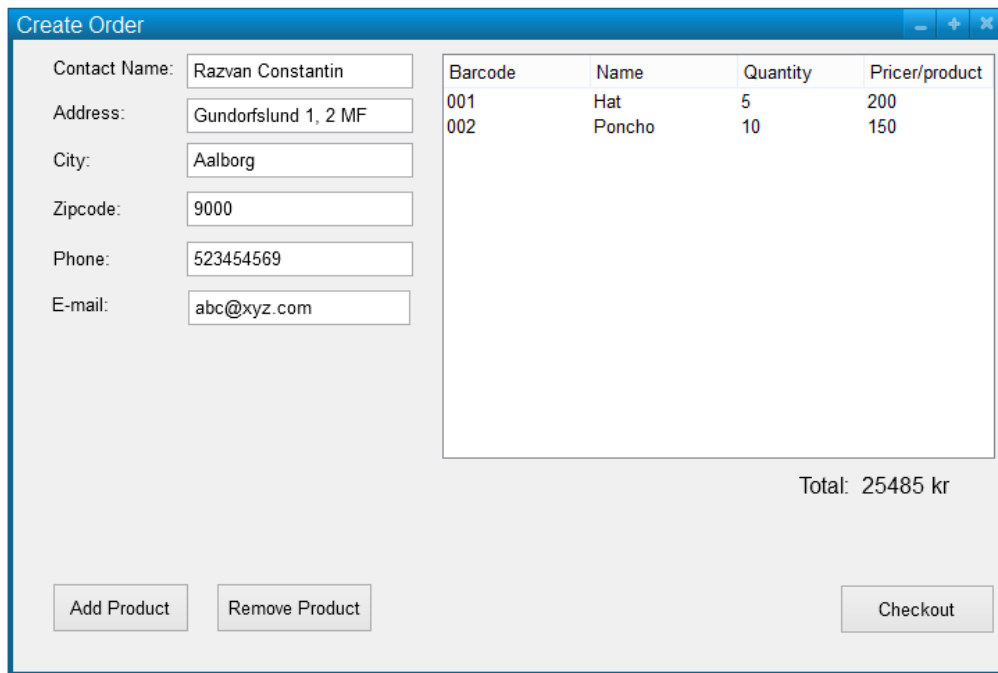

- Istvan Knoll
- Ann Francke Riisberg
- Henrik Munk Hvarregaard

Repository path: <https://github.com/Swiftrow/Group4>

Domain Model

Mock-ups, design and argumentation

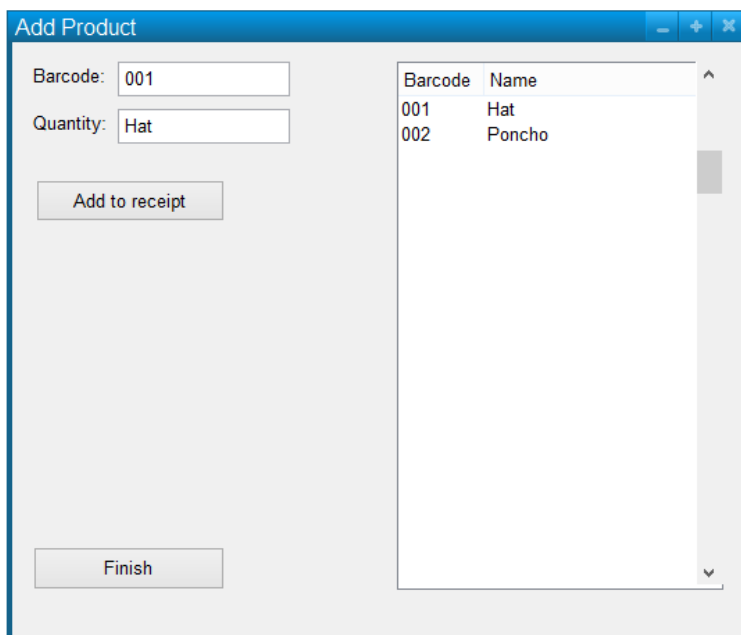

The 'Create Order' window features a contact information section on the left with text fields for Name, Address, City, Zipcode, Phone, and E-mail. On the right, a table lists products with columns for Barcode, Name, Quantity, and Price/product. A total amount is displayed at the bottom right, and buttons for adding/removing products and checking out are at the bottom.

Barcode	Name	Quantity	Price/product
001	Hat	5	200
002	Poncho	10	150

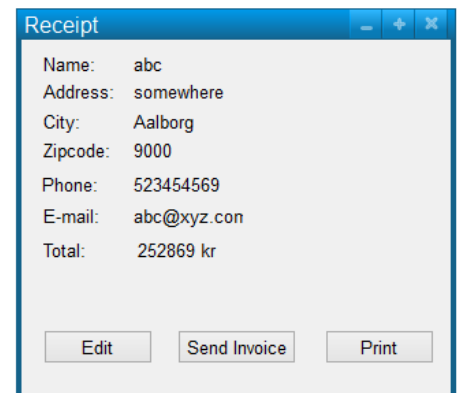

Total: 25485 kr

For designing the windows for our program, we used Pencil. The window has an easy-to-use layout, on the left information is inserted using text fields.

The 'Add Product' window includes text fields for Barcode and Quantity, and a dropdown menu for Name. An 'Add to receipt' button is positioned below the fields. A 'Finish' button is located at the bottom left. A table on the right displays the current list of products.

Barcode	Name
001	Hat
002	Poncho

The 'Receipt' window displays a summary of the order information, including Name, Address, City, Zipcode, Phone, E-mail, and Total. At the bottom, there are buttons for 'Edit', 'Send Invoice', and 'Print'.

Name: abc
Address: somewhere
City: Aalborg
Zipcode: 9000
Phone: 523454569
E-mail: abc@xyz.com
Total: 252869 kr

The SQL Script for the database creation

```
USE [dmai0914_2Sem_4]

```

(This script was generated by program, because when we've created the tables we have done it step by step)

Relational model.

Fully dressed use-case for order processing

Register order		
Actors	Employee/Manager	
Pre-conditions	The desired product is available in stock	
Post-condition	The order is created and the products are added to the invoice	
Frequency	10 times a day	
Main success scenario	Actors(Action)	System(Response)
	1.Employee searches for the desired product	2.System shows if the product(s) are available
	3.Employee adds the products from the database	4.System creates a new order
	5.Employee enters customer's ID and type	6.System calculates the price and makes a discount (if the requirements are fulfilled)
		7.System updates the stock and prints the receipt
Alternative flows	*-Item is not available in the stock	

Interaction diagrams, fully dressed use-case
